

## Lab 05 exercise 04

To ignore a signal we have to specify **SIG\_IGN** as the signal handler in the **signal()** call.

After telling the kernel we want the signal to be ignored, there is no way to know when 5 of these signals have arrived.

The child process therefore sends a **SIGUSR2** signal to reactivate **SIGUSR1**s reception and then sends the last **SIGUSR1** before terminating execution.
