Lab 12 exercise 03

The exercise is easily solved using a single succession of pipes:

1. the file is read using `cat`
2. all space characters are converted to newlines using `tr` (the `-s` flag removes adjacent repetitions of the first set of characters)
3. the output is sorted
4. repetitions are removed using `uniq`, the `-c` flag counts and print the number of successive equal lines
