Lab 04 exercise 02

Modify the range of `n1` and `n2` in parent-child to `[0-100]`. Remake. Run **3** instances of the program parent-child in background using the command:

`parent-child & parent-child & parent-child &`

From a different shell, use `ps` to figure out the PID, and the status, of all the parents and children processes. Terminate **4** of those processes, use `ps` again to figure out the PID, and the status of all remaining processes.
